TITLE: Investigation of the spatial distribution of mu-mesons in extensive atmospheric showers at a depth of 200 meters (water equivalent)

SOURCE: AN GruzSSR. Soobshcheniya, v. 35, no. 1, 1964, 59-66

TOPIC TAGS: meson, mu meson, atmospheric shower, cosmic ray, nuclear physics, atmospheric physics, meson spatial distribution

ABSTRACT: A study of the spatial distribution of the penetrating component of extensive atmospheric showers has been made in the underground laboratory of the Institut fiziki Akademii nauk Gruzinskoy SSR (Institute of Physics of the Academy of Sciences of the Georgian SSR). The selected geometry of the experiment ensured measurement of the density of the mu-meson flux to a distance of 80-100 m from the shower axis. An attempt was made to compute the total quantity of penetrating particles with a minimum energy of 40 Bev and their contribution to the energy balance of the shower and to detect nonuniformities in the mu-meson flux. Determination of the mu-meson component characteristics at a

Card 1/5

ACCESSION NR: AP4042889

depth of 200 m (water equivalent) required determination of the direction of arrival of the axis of the shower because the distance between the mu-meson detectors underground and the axis of the shower recorded at the surface is dependent on the angle of inclination of the axis. Arrangement of the underground apparatus is shown in Fig. 1 of the Enclosure. Scintillation apparatus was used for detecting showers and the inclination of their axes. A pulse from the coincidence circuit of this apparatus triggers both the OK-19 oscilloscope and a blocking generator controlling the operation of two modulators using TGI-1-130/10 thyratrons, one of which triggers the pulse hodoscopes situated on the surface around the building, as shown in Fig. 2 of the Enclosure; another thyratron controls the underground mu-meson detectors. The underground part of the apparatus consists of a system of eight hodoscopic detectors, each separated by lead blocks 10 cm thick. Each detector has an area of 0.5 m<sup>2</sup> and the total area of the underground detectors is 4 m<sup>2</sup>; each detector has a triple-coincidence circuit. During the 1,920 hours of operation the underground detectors were triggered 415 times. The mean dimension of showers (with respect to quantity of particles) was  $6 \times 10^5$ . Densities are given in a table. An expression is given for the distribution, and the results are compared with similar work done at the NIYAF MGU. Orig. art. has: 3 formulas, 6 figures and 1 table.

TITLE: Basic Concepts of Dislocation Theory

PERIODICAL: Československý časopis pro fysiku, 1959, Nr 5,  
pp 455 - 462

ABSTRACT: This work differs from the well-known paper by Frank  
(Ref 1) in several respects. It limits itself entirely  
to geometrical aspects and deals with the concept of the  
dislocation only. The dislocation is rigorously intro-  
duced in a manner accepted in mathematical treatises  
and some theorems are proved.

There are 4 figures and 3 references, of which 2 are  
English and 1 German.

The effect is discussed of change of the characteristic dimensions of a blade profile on the V curve obtained by plotting the ratio  $W/W_h$ , (velocity along the periphery of the blade section, to that of the undisturbed flow), against the lift coefficient. This curve provides a fairly easy means of determining the blade section profiles giving maximum lift coefficient.

TOPIC TAGS: organic synthetic process, drug, carbon, tracer study, hydride, lithium, aluminum, chlorination, cyclic group

ABSTRACT:

The synthesis of the drug Degranol (in the C-14 labeled form) was described. Glycine-1-<sup>14</sup>C ethyl ester was reduced with lithium aluminum hydride to 2-aminoethane-1-<sup>14</sup>C-1-ol, which was converted by chlorination with thionyl chloride into 2-chloroethylamine-<sup>14</sup>C. The latter compound was cyclized in the presence of NaOH to ethylene-<sup>14</sup>C1-imine, which was condensed with 1,2,5,6-dianhydro-3,4-isopropylidene-D-mannitol and the product hydrolyzed to yield <sup>14</sup>C-Degranol labeled on the C atom of the β-chloroethylamino group. TITLE: Studies on the Meerwein-Ponndorf-Verley-Oppenauer reaction. Part 1: Investigation of the reaction mechanism with radiocarbon. Racemization of secondary alcohols

SOURCE: Academia scientiarum hungaricae. Acta chimica, v. 43, no. 2, 1965, 149-153

TOPIC TAGS: carbon, acetone, alcohol, tracer study, aluminum compound

ABSTRACT: Using C-14 labeled acetone and non-labeled aluminum isopropylate it was shown that the Meerwein-Oppenauer reaction takes place in systems having no oxidation-reduction potential differences resulting in an exchange the completion of which depends on the molar ratios only. According to this finding, a possibility was presented for the racemization of optically active secondary alcohols. The mechanisms of the above reactions were explained.

AUTHORS: Kogan, E. V.; Ivanova, A. G.; Revkhsfel'd, V. O.; Smirnov, N. I.  
Gruber, V. N.TITLE: Polymerization of octamethylcyclotetrasiloxane in the presence of acid catalysts

SOURCE: Vyssokomolekulyarnye soyedineniya, v. 5, no. 8, 1963, 1183-1189

TOPIC TAGS: siloxane, polymerization, catalyst, sulfuric acid, potassium dichromate, potassium permanganate

ABSTRACT: The kinetics of octamethylcyclotetrasiloxane (OMCTS) polymerization by sulfuric acid in the presence of promoters was investigated by the conventional viscosimetric method and by an ultrasonic technique described in an earlier paper by E. V. Kogan, N. I. Smirnov, and A. P. Mozhayev (Zh. prikl. khimii, 34, 541, 1961). Into a 50-ml flask were placed 25 ml of OMCTS to which were added (under stirring) various amounts of sulfuric acid, potassium permanganate, or potassium dichromate solutions. It was found that the stirring frequency had no effect on the process. In the absence of oxidizers, 2% by weight of concentrated sulfuric

Card 1/2

L 15604-63

ACCESSION NR: AP3004704

acid resulted within a 6-8 hour interval in a maximum polymerization level (up to 90%) of the original OMCTS. Additional amounts of sulfuric acid increased only the conversion rate. Experiments showed that the dilution of the acid had a detrimental effect on the rate and yield of polymerization, as did the replacement of the sulfuric acid by oleum. A similar detrimental effect was observed when 0.03-1.6 gram-equivalent of potassium permanganate or 0.1-1.0 gram-equivalent of potassium dichromate was added per gram-equivalent of sulfuric acid, the degree of polymerization inhibition increasing with the amount of oxidant added. It was found that at 60°C (in the presence of 1% concentrated sulfuric acid without oxidants) a polymerization level of 80% was reached within 4 hours, while at 20°C it took 9 hours to achieve a 30% polymerization. Orig. art. has: 1 formula and 9 charts.

AUTHORS: Gruber, V. N., Mukhina, L. S.

TITLE: Mechanism of catalytic polymerization of cyclic dimethyl polysiloxanes. II.

PERIODICAL: Vysokomolekulyarnyye soyedineniya, v. 3, no. 1, 1961, 84-87

TEXT: In their previous publication (Ref. 1) the authors were able to show that the catalytic polymerization of cyclic dimethyl polysiloxanes (up to a resinous consistency) is based on redox reactions in the catalyst system (catalyst: concentrated  $H_2SO_4$ ,  $FeCl_3$ ). The present work studies the effect of small quantities of salts and metals with variable valency ( $CuSO_4$ ,  $MnSO_4$ ,  $FeSO_4$ ,  $Fe_2(SO_4)_3$ ,  $KMnO_4$ ) as well as glycerol and ethyl alcohol on the rate of polymerization in presence of concentrated  $H_2SO_4$  and  $Al_2(SO_4)_3 \cdot 2H_2O$  as catalysts. 0.01 g of each of the above-mentioned salts was added to 150 g portions of the initial silicone oil. The reaction mixtures contained 2% catalyst (relative to silicone oil). The experiments showed that the

Card 1/2

Mechanism of catalytic polymerization...

S/190/61/003/001/012/020  
B119/B216

reaction rate is increased 2 - 3 fold by the presence of these compounds. This enables polymerization on  $\text{Al}_2(\text{SO}_4)_3 \cdot 2\text{H}_2\text{O}$  plus a slight amount of concentrated  $\text{H}_2\text{SO}_4$  at room temperature instead of the usually required temperature of 90 - 100°C. Glycerol and ethyl alcohol reduce the reaction rate. Polymerization tests in narrow glass vessels (2.5 cm in diameter and 20 cm high) in presence of  $\text{FeCl}_3$ ,  $\text{Al}_2(\text{SO}_4)_3 \cdot 2\text{H}_2\text{O}$  concentrated  $\text{H}_2\text{SO}_4$  yielded no rubbery products, since polymerization was suppressed by the walls of the vessel. These findings indicate that the redox process (interaction between the lower-oxide, oxide and peroxide forms of the catalyst) underlying the polymerization of cyclic dimethyl polysiloxanes is a chain reaction. The authors thank V. N. Kartsev, M. M. Fomicheva, L. I. Shebalina and M. I. Vinnikovskaya for assisting in the experiments. Mention is made, among others, of a publication by N. N. Semenov. There are 2 tables and 6 references: 10 Soviet-bloc and 1 non-Soviet-bloc.

Mukhina, L. S.

TITLE: Mechanism of catalytic polymerization of cyclic dimethyl polysiloxanes. III

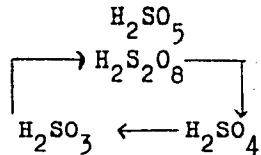

PERIODICAL: Vysokomolekulyarnyye soyedineniya, v. 3, no. 1, 1961, 89-92

TEXT: In previous studies on this subject (Refs. 1,2) the authors were able to show that the polymerization of cyclic dimethyl poly siloxanes by the catalytic action of  $\text{FeCl}_3$ ,  $\text{Al}(\text{SO}_4)_3 \cdot 2\text{H}_2\text{O}$  +  $\text{H}_2\text{SO}_4$  or concentrated  $\text{H}_2\text{SO}_4$  leading to resinous products is due to redox reactions which cause the formation of active centers at which chain-formation takes place. The following redox scheme was suggested for  $\text{H}_2\text{SO}_4$  catalysis:

Card 1/3

Mechanism of catalytic polymerization...

S/190/61/003/001/013/020  
B119/B216

The present work deals with the quantitative evaluation of the redox processes occurring during polymerization by  $\text{H}_2\text{SO}_4$ . The amount of catalyst used for the polymerization tests corresponded to 2% of the silicone oil portion. Samples were drawn at intervals in the course of the reaction and analyzed quantitatively for  $\text{H}_2\text{SO}_3$  (iodometrically, (Ref. 3)) and  $\text{H}_2\text{SO}_5$  (by the method described by L. I. Kashtanov, O. N. Oleshchuk (Ref. 4)), and infrared-spectrographed (in the ~~IK~~-11 (IKS-11) infrared spectrometer) to determine the quantitative relation between cyclic and linear polymer (the former has an intensive band at  $1090 \text{ cm}^{-1}$  and the latter peaks at 1025 and  $1110 \text{ cm}^{-1}$ ). The peak at  $1025 \text{ cm}^{-1}$  characteristic of linear polysiloxanes

Card 2/3

Mechanism of catalytic polymerization...

S/190/61/003/001/013/020  
B119/B216

increases in the course of the reaction, while the peak at  $1090\text{ cm}^{-1}$  corresponding to the cyclic form becomes weaker and shifts to  $1110\text{ cm}^{-1}$ . The findings signify the simultaneous presence of the lower-oxide and peroxide form of the catalyst in the reaction mixture to be due to redox processes involving constant regeneration of these forms. The decrease of  $\text{H}_2\text{SO}_3$  content and simultaneous increase of  $\text{H}_2\text{SO}_5$  content during the reaction process indicate the occurrence of macro stages according to N. M. Emanuel' (Ref. 5). The  $\text{H}_2\text{SO}_5$  content in the reaction mixture is directly proportional to the formation of linear polymer. There are 2 figures and 7 references: 5 Soviet-bloc and 2 non-Soviet-bloc.

AUTHORS: Gruber, V. N., Mukhina, L. S.

TITLE: Mechanism of catalytic polymerization of cyclic dimethyl polysiloxanes. IV

PERIODICAL: Vysokomolekulyarnyye soyedineniya, v. 3, no. 2, 1961, 174-176

TEXT: Polymerization of cyclic dimethyl polysiloxanes (silicone oil) in the presence of the known redox system  $2\text{KMnO}_4 + 3\text{H}_2\text{SO}_4 \rightarrow 2\text{MnSO}_4 + \text{K}_2\text{SO}_4 + 3\text{H}_2\text{O} + 5\text{O}_2$  as catalyst, confirms the assumption that this polymerization is the result of the redox reaction. Silicone oil was filled into a flask provided with a stirrer. Subsequently,  $\text{KMnO}_4$  and  $\text{H}_2\text{SO}_4$  were added: 3.22 g  $\text{KMnO}_4$  and 3 g  $\text{H}_2\text{SO}_4$  per 150 g silicone oil. The weakly pink color indicated the presence of  $\text{Mn}^{++}$ , while the finely disperse brown mass is indicative of the formation of  $\text{MnO}_2$ . The rubber-like specimens were obtained after 1-2 hr at room temperature; no further time was necessary for ripening (Table). If  $\text{Al}_2(\text{SO}_4)_3$  is applied as catalyst, 70 hr are necessary for the ripening. The specimens of the siloxane rubber

TITLE: Behavior of various silicone rubbers and their vulcanizates  
in vacuum at 250—500°C

SOURCE: Kauchuk i rezina, no. 5, 1965, 1-6

TOPIC TAGS: silicone rubber, silicone rubber mix, silicone rubber  
vulcanizate, heterosiloxane rubber

ABSTRACT: An attempt has been made to solve the important problem  
of improving the thermal stability of silicone rubbers by developing  
new types of polymers in which part of the backbone Si atoms is  
replaced by such atoms as B, P, Ti or V. For this purpose a compara-  
tive study was made of the thermal stability of various silicone  
rubbers and their vulcanizates. The experiments were conducted with  
methylvinylsiloxane (SKTV) and methylphenylsiloxane (SKTFV) rubbers,  
and elastomers having atoms of Ti (GSTi), B and F (GSBPV). 15

V (GSV), or B, P and Ti (GSBPT1) in the backbone. The rubbers were prepared and vulcanized by various methods, including irradiation, and were investigated both unfilled and loaded with various fillers. The relative thermal stability of the rubbers, rubber mixes and vulcanizates was estimated from the weight loss of specimens on heating for 2 hr in vacuum at 250—500°C. It was shown that: 1) polymers with Ti or B and P atoms in the backbone (Fig. 1 of the Enclosure) exhibit the highest thermal stability; 2) rubber mixes filled with  $TiO_2$  or  $Fe_2O_3$ , have the highest thermal stability; 3) peroxide and irradiation vulcanizates loaded with identical fillers exhibit a very close thermal stability; 4) heating of rubber mixes and vulcanizates in vacuum at 250—500°C increases the thermal stability of the rubber as a result of the stabilizing effect of the fillers; 5) vulcanizates which give off the same amounts of volatile products on heating in vacuum can considerably differ in the rate of chemical stress relaxation, a fact stressed in view of the use of silicone rubbers as sealants; 6) irradiation vulcanizates of silicone rubbers with Ti or B and P atoms in the backbone, heated in vacuum in the stressed state, present no advantages over SKTV vulcanizates either.

TITLE: Improving the heat resistance of silicone elastomers by the introduction  
of orienting additives 15

SOURCE: Vysokomolekulyarnyye soyedineniya, v. 7, no. 6, 1965, 1122-1123

TOPIC TAGS: silicone elastomer, orienting additive, dimethylsiloxane rubber, heat  
resistant polymer 15

ABSTRACT: The heat resistance of dimethylsiloxane rubber (SKTV) has been increased  
from 250 to 350—400°C by the introduction of orienting additives such as [unspecified]  
oxides, finely divided metals, or naturally occurring polymers. It is assumed that  
the mechanism of action of these additives is associated with their capacity to  
form coordination and polar links between polymer chains. These links cause the  
formation of oriented polymer sections, thus increasing the heat resistance of the  
material. The elastomers were prepared by hydrolytic polycondensation. Orig. art.  
has: 1 figure. [BO]

Pre-critical region of liquids. I. Optical methods of investigation.  
W. Swiatozlawski and L. Gauthier. II. W. Swiatozlawski, T. Gruberski, and S. Woloszczuk. III. Microphotometric method.  
W. Swiatozlawski and T. Markowska. IV. Isochors and iso-therms of post-critical region of  $n$ -heptane. W. Swiatozlawski and S. Woloszczuk (*Rozpr. Chem.*, 1952, 28, 194—201, 302—203, 307—313, 214—220).—I. An optical method for observation of liquid-vapour phase boundaries in the critical region shows that obliteration of the meniscus with rising temp. is gradual; the meniscus persisting at the walls of a tube after it has ceased to exist at the centre.

II. Equalisation of  $d$  in the upper and lower parts of a sealed tube partly filled with liquid ( $C_6H_6$ ,  $CCl_4$ ,  $EtOH$ ,  $EtCl$ , or  $\pi-C_6H_5$ ) takes place at temp.  $\sim 3^\circ$  within that of disappearance of the meniscus. The phenomena in tubes containing air take place at temp.  $\sim 0.5^\circ$   $>$  in those containing only the vapour above the liquid phase.

III. A microphotometric procedure for measuring the breadth of the shadow obtained by lateral illumination of a tube above and below the phase boundary of a contained liquid in the pre-critical region is described.

IV. Apparatus for studying pressure, vol., and temp. of liquids in the pre-critical region is described, applying the procedures outlined above. The breadth of the shadow obtained in the post-critical region, with vol. constant and pressure and temp. variable is a linear function of  $d$ .

The methods of determining naphthalene in coal-tar oil.  
T. Gruberski, *Premysl Chem.*, 9, 336-8(1953). (English  
summary) The method consists of normal distn. of the  
coal-tar oil in the lab. column, collecting the fraction contg.  
C<sub>11</sub>H<sub>8</sub> (I), and detg. its m.p. A 500-g. sample was distd.  
10-g. fractions were taken and frozen until no crystals of I  
were present (smaller fractions b, above 230°). All frac-  
tions contg. I were collected, weighed, the m.p. of a 5-ml.  
sample of the distillate detd., the amt. of I (%) in that  
sample read from a solv. table, and the amt. of I in the  
original sample in g. calc'd. Lack of solv. data of I in oils  
for temp. below 0°, and presence of acidic components,  
which increase solv. of I are the disadvantages, while a short  
time of detn. and lack of foreign azeotropic entrainer are the  
advantages of this method.

✓ 222. INVESTIGATION OF THE ACENAPHTHENE FRACTION. *Colloid Polym. Sci.*, 1957, No. 226, 160-165; *Przem. Chem. (Chem. Ind., Warsaw)*, 1957, Vol. 33, 160-165; *Abstr. Int. Chem. Abstr.*, 1957, vol. 51, 2215. A simple method for studying the course of distillation of the coal tar oils is described. The method consists in measuring the temperature of disappearance of crystals of the samples collected during the distillation and the same samples after recrystallization from methyl alcohol. The term "main component of crystallization" is suggested for that component which precipitates first from the polyvaporous mixture. The acenaphthene fraction was examined by this method. The fraction in which the acenaphthene was the main component of crystallization was isolated.
